

# COOLING TUNNEL DOORS

Pad room system is used in poultry houses for more efficient cooling.

With pad room, cooled air enters the poultry house and thus, more efficient cooling is ensured.

Cold air inlet is prevented during winter months thanks to insulated pad covers.

Air going through automatically operating covers depending on the pressure in the poultry house moves along the entire poultry house with constant speed and without dropping to the ground and thus, ensures a homogeneous cooling.

Method of cover opening prevents direct exposure of poultry to the cold air.

Insulated covers prevent cold air from entering the poultry house during winter months in which they are not used.
